Scripter.NET is a comprehensive library that can help you integrate various C#, VB.NET and JScript scripts and components (engines) into your .NET or WinForms projects. Furthermore, thanks to its basic code editing features, it also makes it possible for you to execute code and debug it if need be. It hardly requires any effort on your part in order be smoothly deployed on your system. That said, you only need to rely on the app's wizard-based installer and to make sure that .NET Framework 4.0 or present on your computer's system. The interface is a fairly straightforward one, with a typical menu bar on the upper part of the main window that hosts all of the tools, a practical toolbar right underneath, an Explorer panel on

the left and a code editor/debugger on the right side. The fact that this library/utility allows you to access the objects directly from the script and extend the app's logic without the need to recompile or redeploy it is probably the app's highlight. However, the comprehensive debugging tools are also worthy of your attention. For example, you can debug single script or projects that containing multiple source files, as well as perform various debugging tasks in separate script processes. It's well worth pointing out that the `Scripter.NET` also comes with support for Start/Stop commands, breakpoints, as well as call stack and expression evaluation. ... So, once you've installed the app, you can use its scripts and components (engines) from your scripts. The key here is that `Scripter.NET` is open source and free of

charge. As with all open source solutions, it has two main modes of operation. The first one, which is obviously preferable, is to configure your app's settings directly from the script. The second one is useful when working with an existing app that you want to debug from within your scripts.

How to install and use Scripeter.NET scripts and components

To use the app's scripts and components, you need to download them first. As mentioned, you can choose one of the two installation methods: Using the wizard-based installer. Using command line parameters. The first option can be invoked via the app's shortcut or tray icon. The second is more straightforward. It simply needs a few steps to be executed. You can find the detailed guide that will explain them all

here.
